DETAILED ACTION

Claim Rejections - 35 USC § 112

Changes to claims 1, 2 and 13 have been reviewed and accepted; therefore, rejection under 35 USC § 112 has been withdrawn.

Allowable Subject Matter

1. Claims 1-9 and 11-13 are allowed.

Reasons for Allowance

2. The following is an examiner's statement of reasons for allowance:

Regarding claims 1 and 13, the prior art of record teaches of a communication system and method having a downlink data channel for transmission of data packets from a primary station to a secondary station, a first uplink control channel for transmission of information relating to reception of data packets from the secondary station to the primary station, and a second uplink control channel for transmission of pilot information, the secondary station having receiving means for receiving a data packet and acknowledgement means for transmitting a status signal on the first control channel to the primary station to indicate a status of a received data packet; and where the secondary station comprises power control means for temporarily increasing a transmission power of at least a part of the second uplink control channel including the pilot information for a predetermined period during which the status signal is transmitted.

The prior art of record fails to teach **where the communication system further comprises an uplink data channel, a gain factor being defined as a ratio between**

the transmission power of the second uplink control channel and a transmission power of the uplink data channel, and means for adjusting the gain factor for a duration of a transmission power increase of the part of the second uplink control channel, thereby maintaining the transmission power of the uplink data channel at a similar level to that before the transmission power increase.

Regarding claim 2, the prior art of record teaches of a primary station for use in a communication system having a downlink data channel for transmission of data packets from the primary station to a secondary station, a first uplink control channel for transmission of information relating to reception of data packets from the secondary station to the primary station, and a second uplink control channel for transmission of pilot information, where means are provided for receiving a status signal on the first control channel indicating a status of a data packet transmitted to the secondary station, closed loop power control means are provided for controlling a power of the second uplink control channel, and means are provided for adjusting the operation of the power control means for a predetermined period around a time when transmission of the status signal by the secondary station is expected to take into account a temporary increase of a transmission power of at least the part of the second uplink control channel including pilot information.

The prior art of record fails to teach **where the communication system further comprises an uplink data channel, a gain factor being defined as a ratio between the transmission power of the second uplink control channel and a transmission power of the uplink data channel, and means for adjusting the gain factor for a**

duration of a transmission power increase of the part of the second uplink control channel, thereby maintaining the transmission power of the uplink data channel at a similar level to that before the transmission power increase.

Regarding claim 6, the prior art of record fails to teaches of a secondary station for use in a communication system having a downlink data channel for transmission of data packets from a primary station to a secondary station, a first uplink control channel for transmission of information relating to reception of data packets from the secondary station to the primary station, and a second uplink control channel for transmission of pilot information, where receiving means are provided for receiving a data packet from the primary station and acknowledgement means are provided for transmitting a status signal on the first control channel to the primary station to indicate the status of a received data packet, where power control means are provided for temporarily increasing a transmission power of at least a part of the second control channel including the pilot information for a predetermined period during which the status signal is transmitted.

The prior art of record fails to teach **where the communication system further comprises an uplink data channel, a gain factor being defined as a ratio between the transmission power of the second uplink control channel and a transmission power of the uplink data channel, and means for adjusting the gain factor for a duration of a transmission power increase of the part of the second uplink control channel, thereby maintaining the transmission power of the uplink data channel at a similar level to that before the transmission power increase.**

3. Claims 3-5 and 7-12 depend on allowed claims 2 and 6, respectively; therefore, the examiner gives the same reasons for allowance as set forth above.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
